or visit [vvardis.com](http://vvardis.com)

Tackling cavities  
without drilling,  
injecting or pain  
is now possible.

### CURODONT™ REPAIR FLUORIDE PLUS

- No drilling or injection needed
- Easy, pain-free and fast application
- For permanent and primary teeth
- Suitable for all patients, including children
- Created and developed by dentists

No pain.  
No drill.  
The future  
of oral health.

Ask your dentist or dental hygienist  
for CURODONT™ REPAIR FLUORIDE PLUS  
for drill-free cavity prevention.

# How do cavities occur?

Cavities occur because the tooth loses minerals due to acid produced by bacteria. This process is called **demineralization**. Contrary to popular belief, cavities do not start with a hole, but they **develop invisibly, below the tooth surface**. At this stage, they may still be reversed without drilling.

## Healthy tooth anatomy

- 
  - Enamel.** The outermost layer of the tooth crown and hardest tissue in the body, made of minerals.
  - Dentin.** Supports the enamel and protects the pulp
  - Pulp.** Innermost vital part containing blood vessels and nerves.
  - Cementum.** Thin layer that helps attach the tooth to the jaw bone.

## Initial stage cavity.

Early cavities in the enamel are slightly below the surface and may be **invisible, but they are still reversible**. However, left untreated at this stage, they can become irreversible, and must be managed by drilling and filling.

## Irreversible cavity progression.

Untreated cavities progress through the enamel, invading the dentin and **causing pain**. A deep cavity is then formed, which can only be treated by **drilling and filling the tooth**.

# A painless, drill-free future.

**CURODONT™ REPAIR FLUORIDE PLUS**, by vVARDIS, is an innovative, **painless, drill-free solution for fighting early cavities**.

Thanks to vVARDIS' patented technology, your cavity can be treated at an early stage not by injection and drilling but by remineralizing the enamel **naturally – without any pain**.

Curodont™ Repair Fluoride Plus acts where it is needed. The **unique formulation** helps minerals, like fluoride together with calcium and phosphate from our own saliva, to **remineralize and reharden the enamel**.

Sometimes appearing as a white spot, the demineralization occurs **below the surface** that is still intact.

The dental professional applies **CURODONT™ REPAIR FLUORIDE PLUS** in office.

Within 5 minutes, the **CURODONT™ REPAIR FLUORIDE PLUS** technology **diffuses into the enamel**.

Once inside the tooth, this breakthrough technology attracts minerals from saliva and **remineralizes the enamel** over the next few weeks.
